

Replacing grip on your boom tube is easy to do.

You will get very satisfactory results if you do it meticulously.

This is why we highly recommend you to respect carefully the following instructions.

Instructions:

1. Convenient temperature for replacing grip on boom tube is 16°C minimum.
2. Unstick the old grip using a knife.
3. Sand the tube with the coarse glass paper and then wash it with solvent (acetone).
4. Sand again with coarse glass paper to prepare the surface.
5. Apply the glue first on the clean tube and then on the interior side of the grip.
6. Let the glue dry (time depends on the type of glue you are using).
7. Stick the grip on the clean tube. The joint of the grip must imperatively be on the exterior side of the boom tube. **Be careful not to leave any air bubble** between the grip and the tube.
8. Cut the exceeding grip with a cutter.
9. Sand the joint with fine glass paper to get smooth surface.

TIP: use a fine glass paper to create a chamfered edge at each strip. Apply glue at this edge too. You will get a better finish.
